191	Medications are coded according to the pharmacological classification, not their use. For example, if a resident is given ASA 81mg to prevent clot formation, the ASA would be captured as an analgesic in O4f.	When acetylsalicylic acid (ASA) is given once a day as an antithrombotic agent, regardless of dose, it is considered an **antithrombotic** agent and should not be captured as an analgesic in O4f. When given in multiple doses per day, regardless of dose, it is considered an analgesic and should be captured as such in O4f. If ASA is given once a day as an analgesic, regardless of dose, it should be captured as an analgesic in O4f.
